

ApateDNS Crack With Registration Code Free Download [Latest]

ApateDNS Crack Full Version Free PC/Windows

This is the world's first and only program of its kind. Get around the system and online censorship easily with a simple-to-use software application that never lets you down, regardless of your operating system. ApateDNS is guaranteed to always work. Why use it? Change the results of DNS queries in real time, no matter what. The DNS spoofing software used by the NSA is the only thing that can solve this problem. You can effectively prevent hacking, government attacks, cyberbullying, and even make some money with it. No root privileges required. Use ApateDNS just like your normal software. The software is free, but donations are welcome. Disclaimer: APATEDNS is not affiliated to any software company. We don't have any services, nor we promise to get you any particular result in any case. Press the download button below and follow the installation instructions to install ApateDNS. Link: API documentation API-Documentation Show more Show less This application provides the following resources: Manual: API-Documentation System requirements Minimum: OS: Windows XP Windows 7 Windows 8/8.1/10 Processor: 1.0 Ghz and above 1.4 Ghz and above Memory: 32 MB 64 MB 1 GB 320 MB 2 GB Disk space: 150 MB Download size: 1.1 MB License: Free and Freeware, Short description of ApateDNS License: Free and Freeware, Full description of ApateDNS Download from the author's website Supported languages: English 1.0 Ghz and above Memory: 64 MB 1 GB 320 MB 2 GB Disk space: 3 GB Click on the button to download ApateDNS from the website, and follow the instructions to install it on your computer. ApateDNS will be installed as a portable application, which means that it is easy to install on USB flash drive or external hard drives that you can use whenever you need to perform a manual test. If you don't have a USB flash drive, you can still use Apate

What's New In ApateDNS?

ApateDNS is a lightweight software application whose purpose is to help you manage DNS responses for a user-specified IP address by listening on UDP port 53 on the local machine. It comes in handy especially for network administrators who need to track DNS requests made by malicious software, trick the malware to send its traffic to a host, as well as catch additional domains used by viruses with the aid of the non-existent domain option. Installation: Double-click apate_dns.exe to start the application. Once the installation process is complete, go to the Options and start the ApateDNS service. A window will appear asking for your password. Start / stop: Press the Start button to start the service. Press the Stop button to stop the service. Interface: Select the interface from which you want to receive the DNS requests on. You can specify only one interface. DNS server address: Enter the IP address that is required for the DNS responses, or select the IP address from the list. Number of non-existent domains: Enter the number of non-existent domains that the DNS server is supposed to respond to before responding with a valid response for each DNS query. Ip / Net / Host: Select the type of interface that the DNS server will listen to. You can choose one of the following options: Ip - DHCP Net - DHCP Host - DHCP Start / Stop the service: Press the Start button to start the service. Press the Stop button to stop the service. Help / About: Press the Help button to display the ApateDNS help file. Press the About button to display a window containing information about the program. More advanced options: Press the Advanced button to display a window containing more options. Dns server password: Enter the password that is required for the DNS server to receive requests. Note: If you do not enter a password for the DNS server, the program will respond to all DNS requests regardless of their IP address and will respond to a specific IP address regardless of the number of non-existent domain responses that should be sent for each DNS query. Conclusion: All in all, ApateDNS is a lightweight and portable software application that allows you to spoof DNS responses to a user-specified IP address, and is designed for network administrators.
