Navajo-Cad Cracked.Document Type Article Journal/Book Title/Conference Accounts of Chemical Research Volume 30 Issue 2 First Page 104 Last Page 105 Department Environmental Chemistry Abstract Lime, MgO, and SiO₂ form a standard series in the smectite series and are strong sorbents for anionic organic pollutants. The sorption was measured using high precision quartz crystal microbalance (QCM). The results show that the in situ formed slurry used for the sorption studies on quartz crystal microbalance (QCM) by adding deionized (DI) water to the carbonate-rich starting slurries are heterogeneous consisting of both sorbent particles and aqueous and solid precipitates. The reactions are quenched by washing and centrifuging. The solid precipitates are dispersed in deionized (DI) water and then applied to the QCM. Addition of formic acid to the aqueous phase (1.0 μMol) changes the pH of the system from 5.5 to 9.8. This causes strong precipitation of chromium ions which remain dissolved in the aqueous phase and no solid precipitates. The addition of formic acid at the start of the reaction induced precipitation of chromium ions from the solution when the pH of the system went above 9.8. The alkaline pH (pH 11) during the formation of MgO-SiO₂ slurry stabilized the solution for chromium ion removal. The addition of sodium formate to the system (1.0 μMol) after the formation of the sorbent-solution system leads to the disappearance of precipitation. By adding sodium formate (1.0 μMol) and acidifying the system, precipitation and the stabilizing effect of the alkaline pH (pH 11) were obtained in a single step. To the compound, [Formula: see text] (wherein the carbon-centered radical is attached to the phenyl ring), was attached to the graphene oxide (GO). The GO was dissolved in deionized (DI) water to form a GO (aqueous solution). To the [Formula: see text], aniline was added. The [Formula: see text] reacted with the aniline and formed a [Formula: see text]-
